

Mass Content Upload Process

This script does quality control checks, including matching the box/folder in the metadata to the EAD

This script creates JPEG copies of the TIFFs - it places them in the MassContent/jpegs folder - for each TIFF, there should be a _2048.jpg and a _128.jpg

This script creates MODS based on the .log.txt file; it also retrieves a PURL for each item, which it includes in the MODS and adds to a new copy of the EAD - it places the MODS in the MassContent/MODS folder, the new EAD in MassContent/EAD, and the old EAD in MassContent/backups

This script moves JPEG copies and stub MODS into Acumen

This script copies the original TIFFs and other documents from the share drive (Completed) to the server (Deposits) - if successful, it will delete the originals from the share drive; the script also initiates OCR creation for selected content

This script moves the updated EAD to Acumen
